

With ScenePD, you can draw clear diagrams, add photos and videos, and save everything directly into your Records Management System (RMS). This tool saves time, reduces work, and makes sure every important detail is captured correctly, so you can focus on solving cases.

ScenePD Options

If you're interested in Smart**Safety** Software's ScenePD product, you'll notice there are three different options for purchase – Desktop, Editor, and Web.

Desktop

Think of our Desktop version like а Microsoft Office product – it is an app installed on your PC. You use our Desktop version to create diagram-centric documents that can be saved as files, printed, or exported in other formats like images and PDFs. Integration with your RMS or Crash Reporting System may be limited and require you to manually upload the exported drawings into your system.

Editor

The Diagram Editor is used with RMS primarily applications that are installed on individual workstations. It is designed for integration into products that are developed using .Net or COM. This means that your RMS provider is in control of how and when the diagram editing tool is viewed and used and it can be embedded into your RMS or Crash Reporting System workflow.

Web SDK

Web SDK looks like Editor, but it is never installed on an end-user's laptop or workstation. This option is installed on the server that hosts the web-based RMS or Crash Reporting System. It is designed to be embedded in a browser-based application, like an RMS that is accessed via a web browser. You can also embed the diagramming process into your RMS or Crash Reporting System workflow.
